# default PHP GET/POST Requests
vs.
crVCL MVC Events

Application Logic and Controlling is mixed with Database requests and the generation of HTML output.

The consequence is a confusing fault-prone and not maintainable code.

- provides a clean separation with consistent workflow
- easier to test code
- promotes better code organization, extensibility, scalability and code re-use
- facilitates de-coupling the application's layers
- work with method calls like in Java or .NET
